

# Zwicky Transient Facility

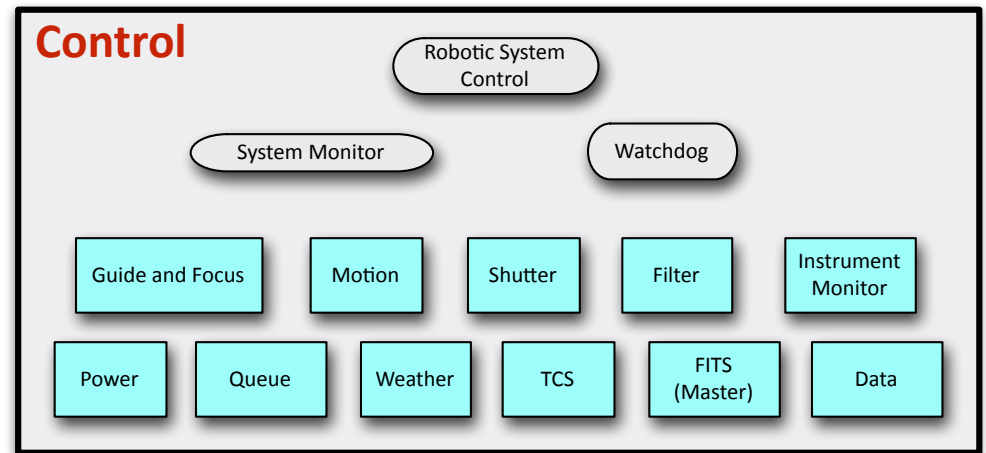

## Robotic Control Software Architecture

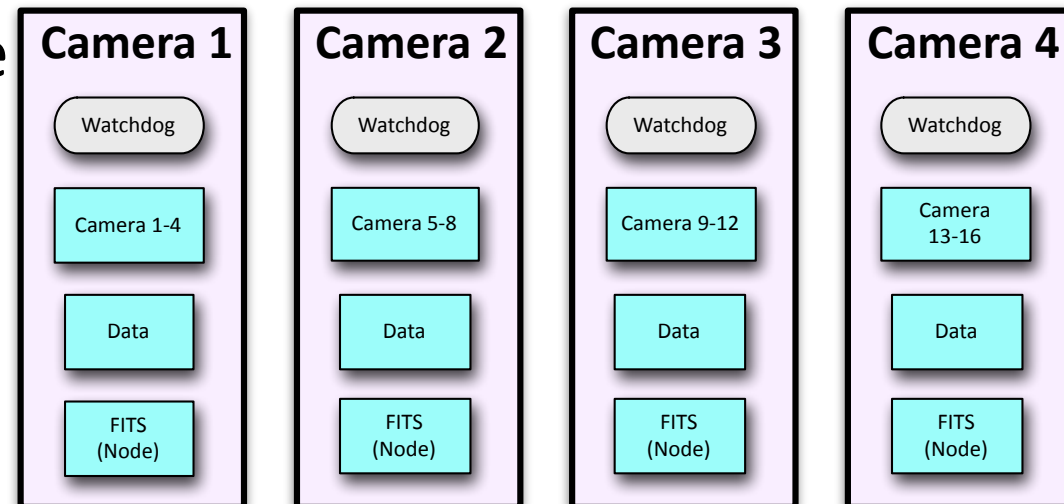

# Computer System Architecture

- Control computer contains most functions
  - Interfaces to hardware
  - Robotic control system

- Camera computers have one Archon controller each

- New data manager
  - All systems
  - Controls upload of IPAC data

# Observing Loop Functions

- Prepare observation
  - Get queue target information 100ms
  - Filter exchange 60-90s
  - Point telescope ?
  - Setup mosaic for image 1.9s
- Take a science image
  - Arm Archon controllers 30ms
  - Take science image Exposure time + 50ms
- Write FITS data
  - Synchronize FITS headers 300ms
  - Arm Archons to readout 55ms
  - Readout image data 11-21s
  - Write FITS files 9.5s

# Observing Loop Functions

- Prepare observation
  - Get queue target information 100ms
  - Filter exchange 60-90s
  - Point telescope ?
  - Setup mosaic for image 1.9s
- Take a science image
  - Arm Archon controllers 30ms
  - Take science image Exposure time + 50ms
- Write FITS data
  - Synchronize FITS headers 300ms
  - Arm Archons to readout 55ms
  - Readout image data 11-21s
  - Write FITS files 9.5s

**Total Overhead: ~35s**

**Requirement: 15s**

# Observing Loop Operation

- Basics working, still have some things to sort out
  - Simulated telescope, CCD readout, FITS writing
  - Lots of details to check through
- Current observing loop overhead time: **~13s**
- Overlapping camera operations required, tricky
  - Archon can only take one command at a time
    - Should be able to handle parallel commands
    - Memory transfer while taking a new image
    - Observation preparation, CCD readout overlap
  - Camera software requires modification to support overlapping data readout & FITS writing
- FITS synchronization has to capture the right data
- Detect shutter closure, wait before readout?

# Data Synchronization

- Data synchronization daemon
  - Manages transfer of data to external site
  - Robotic system only transfers relevant data to IPAC
    - Guide/focus data transferred in the morning
- Once image files are created:
  - Robotic system tells data system what files to look for
  - Data system adds new files to **synchronize** list
  - Attempts to transfer 3 times
    - If successful, add to **completed** list
    - If transfer fails, add to **failed** list
  - When synchronize list is empty, retry failed list images
- Works in parallel to observing system
- Software almost ready for testing
